 1968.

LANTANA RIEDELIANA var. PUBESCENS Moldenke, var. nov.

Haec varietas a forma typica speciei ramulis petiolisque foliisque dense pubescentibus recedit.

This variety differs from the typical form of the species in having its young branchlets, petioles, peduncles, and both leaf-surfaces densely pubescent.

The type of the variety was collected by Guido F. J. Pabst (no. 9310) at 2000 meters altitude at Itatiaia, "km. 10 da estrada de Registro para o Planalto", Rio de Janeiro, Brazil, on February 17, 1969, and is deposited in my personal herbarium at Plainfield, New Jersey. The collection is also no. 42395 in the Brade Herbarium at Rio de Janeiro. The collector describes the plant as a shrub, 1 meter tall, with rose-colored flowers.

PHYLIA STRIGULOSA var. SERICEA (Kuntze) Moldenke, comb. nov.
